Table B92. If you ever feel afraid, is there someone you can talk to?	227

Appendix C228

State sample strategies	228
-------------------------------	-----

Executive Summary

The National Core Indicators (NCI) are standard measures used across states to assess the outcomes of services provided to individuals with intellectual/developmental disabilities and their families. Indicators address key areas of concern such as employment, respect/rights, service planning, community inclusion, choice, and health and safety. The data that result from NCI surveys are often used to inform strategic planning, produce legislative reports, and prioritize quality improvement initiatives. Many states also share the data with stakeholder groups such as Quality Councils and use the stakeholder feedback to help set priorities and establish policy direction.

The NCI Adult Consumer Survey is administered to individuals with a developmental disability who receive at least one service other than case management. Not all states that participate in NCI administer the Adult Consumer Survey on an annual basis. Of the 33 states and 22 sub-state entities who participated in NCI during the 2012-2013 data collection cycle, 25 states submitted a valid sample of Adult Consumer Survey data. This Final Report provides a summary of results based on data submitted by June 30, 2013. Below is a summary of findings from the 2012-13 Adult Consumer Survey.

Choice

Overall, individuals across states report having less input in life decisions than in everyday choices. Most people report that they choose their daily schedule (81%), how to spend their free time (91%), and what to buy with their spending money (87%). However, one-half of all respondents report that they chose where to live (50%), 43% say they chose the people with whom they live, and 58% say they chose their day program or activity. Notably though, 83% of respondents report that they chose their job.

Community Inclusion

On a monthly basis, individuals most frequently go out in the community for exercise (6.9 times), shopping (4.1 times), and to go out to eat (3.8 times). On average, individuals went out on errands 2.9 times per month, out for entertainment 2.6 times per month, to religious services or spiritual practices 1.8 times per month, and on vacation 0.8 times per year.

Employment

Overall, 15% of respondents are employed in a paid community job; of these, 35% are in individually supported employment, 33% in competitive employment, and 32% in group-supported employment. Overall, individuals in individually supported employment work slightly fewer hours in an average 2-week period (25.4) compared to those in competitive and group-supported employment (26.9 and 26.5 hours, respectively). However, those in individually supported employment earn a slightly higher hourly wage than those in competitive and group-supported employment (\$8.48 as compared to \$8.15 and \$6.44, respectively).

Of those who do not have a paid job in the community, nearly one-half (49%) report that they would like to have one. Slightly less than one-quarter of respondents have integrated employment as a goal in their service plan (24%). Nearly three-quarters of individuals across states attend a day program or other regularly scheduled day activity (72%), and about one-third report doing volunteer work (34%).

Self-Determination

Across states, 11% of individuals use self-directed supports. Just over three-quarters say they have someone to talk to about budget and services (77%), and 88% report that someone helps them decide how to use their budget and services. The majority say they can make changes to their budget and services if needed (81%), and 38% report that they need more help deciding how to use their budget. Of the 78% of respondents who report that they get enough information about how much money is left in their budget, 63% say that information was easy to understand.

Relationships

More than three-quarters of respondents say they have friends other than family and staff (77%) and 80% report that they have a best friend. A majority also report that they can see their family and see their friends when needed (79% and 78%, respectively) and that they can go out on a date if they want (84%). Less than half of all respondents report that they feel lonely (41%), and most say they can help others if they want (86%).

Satisfaction

The majority of individuals across states report that they like their home and neighborhood (90% and 88%, respectively) while slightly more than one-quarter (26%) say they want to live somewhere else. Just over two-thirds of all respondents say they talk to their neighbors (68%). Most people report that they like their paid job in the community (92%) while 28% report that

they want to work somewhere else. Similarly, 90% report that they like their day activity or program while 31% want to go somewhere else or do something else during the day.

Service Coordination

Nearly all respondents have met their case manager/service coordinator (94%). Moreover, the majority say their case manager/service coordinator asks them what they want (87%), helps them get what they need (88%), and calls back right away (75%).

Nearly all respondents report that staff arrive when they are supposed to (93%) and that they get the help they need to fix problems with staff (91%). Most respondents also say they were able to help make their service plan (85%).

Access

Across states, 82% of respondents report that they get all the services and supports they need, and 83% say they always have a way to get places. The vast majority of respondents say that their staff have the right training to meet their needs (92%).

Health

Nearly all respondents have a primary care doctor (98%), and only 4% of respondents were reported to be in poor health. Most respondents had an annual physical exam in the past year (89%), and the majority receive other regular health exams according to recommended schedules: 80% had a dental exam, 57% had an eye exam, and 56% had a hearing test. More than two-thirds of female respondents had a pap test in the past three years (68%) and almost three-quarters of all female respondents age 40 and over had a mammogram in the past two years (74%). Across states, nearly half of male respondents age 50 and over had a PSA test in the past year (47%). However, only 22% of individuals age 50 and over had a colorectal cancer screening in the past year.

Just over three-quarters of respondents had a flu vaccine in the past year (76%) and 36% had had a pneumonia vaccine at some point in their life.

Medication

Across states, slightly more than half of all respondents were taking at least one medication to treat a mood disorder, anxiety, behavior challenges, and/or a psychotic disorder (53%).

Wellness

Less than one-quarter of respondents engage in regular physical activity (22%). Just over one-third of respondents are obese (34%), 29% are overweight, 31% are a normal weight, and 6% are underweight. Across states, 7% of respondents chew or smoke tobacco.

Rights and Respect

Across states, most respondents indicate that others respect their rights and privacy: 89% report that others let them know before entering their home, and 82% report that others let them know before entering their bedroom; 80% can be alone at home with visitors; 91% report having enough privacy; 85% report that no one opens or reads their mail or email without their permission; 90% say they can use the phone and Internet without restriction; and 93% report that their staff treat them with respect. Less than one-third report that they either attended a self-advocacy meeting or were given the option but chose not to attend.

Safety

Across states, most respondents say they do not feel afraid or scared at home (81%), in their neighborhood (85%), or at their day program or activity (87%). The majority of respondents also report that they have someone to go to for help if they feel afraid (92%).

I. Results

This section briefly describes the structure of the survey instrument and presents the results of the most recent data collection cycle.

Survey Development

The Adult Consumer Survey was initially developed by a technical advisory subcommittee for the purpose of collecting information directly from individuals with developmental disabilities and their families or advocates. The survey is designed to measure more than half of the original 60 core indicators. Many questions were drawn from survey instruments already in use in the field; others were developed specifically for NCI. NCI staff routinely test and refine the instrument based on feedback from surveyors.

Most participating states use the basic survey tool developed by the project. However, some states opt to incorporate additional survey questions to look more deeply at specific issues. The addition of supplementary questions is typically done after a state participates in NCI for at least a year and establishes baseline results.

Organization of the Survey

The Adult Consumer Survey consists of a pre-survey form, three distinct survey sections, and a surveyor feedback form. Each is described below.

Pre-Survey Information: This form has questions that help the surveyor prepare for the meeting as well as assist the surveyor in administering the survey questions. Pre-Survey information is not received by HSRI and thus not included in this report; it is for state use only.

Background Information: This section consists of questions about demographics, residence, health, employment status, and services and supports. Data is generally collected from state records, case managers, or a combination of both.

Section I: This section attempts to determine the individual's level of satisfaction and opinions. It may *only* be completed through a direct meeting with the individual.

Section II: This section contains questions that are answered by a direct meeting with the individual when possible. If the person is unable to respond, a proxy who knows the person well may be used. Case managers or service coordinators are not allowed to respond to these questions on the individual's behalf.

Surveyor Feedback Sheet: This form is used to record information such as the length of the NCI meeting with the individual and any problematic questions encountered.

Presentation of Data

The following two subsections of this report detail results from the 2012-13 data collection cycle. Demographic results are presented first. Tables display demographic results listed alphabetically by state. Outcomes are then displayed for all Adult Consumer Survey results. Items are grouped by domain and are presented in both chart and table form.

Demographic Characteristics of Respondents

Twenty-five (25) states and one regional council administered the Adult Consumer Survey in 2012-2013 and submitted valid samples for analysis. Together, survey information was collected on a total of 13,157 individuals. The participating states represented are: Alabama (AL), Arkansas (AR), Connecticut (CT), Florida (FL), Georgia (GA), Hawaii (HI), Illinois (IL), Indiana (IN), Kentucky (KY), Louisiana (LA), Maryland (MD), Mid East Ohio Regional Council (MEORC), Missouri (MO), Mississippi (MS), North Carolina (NC), New Hampshire (NH), New Jersey (NJ), New York (NY), Ohio (OH), Oregon (OR), Pennsylvania (PA), South Carolina (SC), Texas (TX), Utah (UT), Virginia (VA), and Wisconsin (WI).

This section presents descriptive information on the respondents surveyed, including an aggregate demographic profile. The tables on the following pages illustrate respondent characteristics by state and include the NCI Average (the average of all states' means). Demographic information used for outcome adjustment is noted with an asterisk (*).

Profile of Respondents for Overall Sample

Across states, the average age of individuals is 42 years old, and males represent 58% of the sample. (Notably, males outnumbered females across all NCI states.) The majority of individuals were identified as white (72%) or black/African-American (20%); 4% were identified as Hispanic. The greatest proportion of individuals across NCI states live with a parent or relative (38%) while 29% live in a group home, 14% live in their own home or apartment, and 7% live in a foster or host home.

Just over one-third (34%) of individuals across states are reported to have a mild intellectual disability (ID) and 29% a moderate level of ID. Alternatively, 14% are labeled as having severe ID, and 11% have profound ID; 6% do not have an intellectual disability and 3% have an unknown level of ID. The most common disability types other than ID are: seizure disorder (25%), another disability not specified (23%), and mood disorder (22%).

The majority of individuals communicate verbally (76%), and 19% communicate with gestures. Just over three-quarters are able to move independently (76%) while 15% move with an aid; 9% of individuals across states are non-ambulatory.

Core Indicator Outcomes and Comparisons Across States

Results are divided into subsections that correspond with the survey's sub-domains. Each subsection begins with the sub-domain to be addressed along with its corresponding concern statement and indicators. Charts illustrate un-collapsed averages for all unadjusted indicators. Corresponding tables show collapsed data broken out by state and include the NCI Average as well as the number of respondents by state and in total⁷.

Tables are formatted so that all states are listed in descending order of percentage and are categorized as statistically significant above the NCI Average, within the range of the NCI Average, and significantly below the NCI Average. Risk-adjusted indicators are noted in text with the table. Notably, significance testing was not performed for risk-adjusted indicators and state results are simply presented in descending order.

Statistical significance is taken at the $p < 0.005$ level. The NCI Average represents the average of all state averages.

Please Note: Statistical significance is influenced by the size of the state's sample. Therefore, it is possible that a state with a lower percentage but a larger sample will be classified as significantly above average while a state with a somewhat higher percentage but a smaller sample will not.

The tables also break out average results for each state by the type of residence: institution, community-based group residence, independent home/apartment, and parent/relative's home. These breakouts were not performed for indicators that were risk-adjusted. Significance testing was not performed on indicators by residence, and the number of people in each residential setting is often too small to allow for valid state-to-state comparisons. For the same reason, in many cases statistically valid conclusions cannot be drawn about differences between residence types. This information is provided for states' internal purposes and should not be used to compare one state with another. If a state had fewer than 20 people in a residence type with valid responses to a given question, the rate for that residence type is not reported. Table 16 below presents, by state, the number of people surveyed in each residence type.

⁷ See Appendix A for how questions are collapsed and Appendix B for uncollapsed data by state.

Choice and Decision-Making

People make choices about their lives and are actively engaged in planning their services and supports.

The Choice and Decision-Making indicator is:

1. The proportion of people who make choices about their everyday lives, including: housing, roommates, daily routines, jobs, support staff or providers, social activities, and what to spend money on.

The Adult Consumer Survey includes nine choice items that correspond to the Choice indicator; all but one item, “Chose Case Manager” (Table 27), were risk-adjusted.

Tables 17 through 27 present the results for these items.

Two Choice composite scale scores were produced by adding and averaging Choice items. The Life Decisions scale (Table 25) refers to choice of: residence, work, day activity, staff, and roommates. The Everyday Choices scale (Table 26) refers to choice of: daily schedule, how to spend money, and free time activities. Both scales were risk-adjusted.

All un-collapsed and unadjusted data frequencies for these survey questions are displayed in Appendix B.

Community Inclusion

People have support to participate in everyday community activities.

There is one Community Inclusion indicator:

1. The proportion of people who regularly participate in integrated activities in their communities.

Seven items from the Adult Consumer Survey were used to measure this indicator. These items assess how often consumers:

1. Go shopping (in the past month)
2. Go out on errands or appointments (in the past month)
3. Go out for entertainment (in the past month)
4. Go out to eat (in the past month)
5. Go to religious services (in the past month)
6. Go out for exercise (in the past month)
7. Go on vacation (in the past year)

The seven items were risk-adjusted and are presented in Tables 28 through 34.

Results from the Community Inclusion composite scale score, shown in Table 35, were produced by adding four of the items: the number of times the person went shopping, on errands, for entertainment, and out to eat. The Community Inclusion scale was risk-adjusted.

All un-collapsed and unadjusted data frequencies for these survey questions are displayed in Appendix B.

Work

People have support to find and maintain community integrated employment.

There are 11 Work indicators measured by the Adult Consumer Survey:

1. The percentage of people with a paid job in the community.
2. The average number of hours worked biweekly by people with jobs in the community.
3. The average biweekly earnings of people with paid jobs in the community.
4. The average biweekly hourly earnings of people with a paid job in the community.
5. Of those with a paid job in the community, the percentage of people who were continuously employed throughout the previous year.
6. Of those with a paid job in the community, the average length of time they have been working at their current job.
7. Of those with a paid job in the community, the percentage of people who receive vacation and/or sick time benefits.
8. The percentage of people who have a goal of integrated employment in their service plan.
9. The percentage of people who do not have a paid job in the community but would like to have one.
10. The percentage of people who go to a day program or have some other daily activity.
11. The percentage of people who do volunteer work.

Additionally, NCI reports on the type of paid community jobs individuals have (individually supported, competitive, or group-supported), as well as the most common jobs individuals hold.

Tables 36 through 48 present items from the Work domain. All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

Self-Determination

People have authority and are supported to direct and manage their own services.

There are six indicators measured by the Adult Consumer Survey:

1. The proportion of people who are currently using a self-directed supports option.
2. The proportion of people self-directing who report that someone talked with them about their individual budget/services.
3. The proportion of people self-directing who have help in deciding how to use their individual budget/services.
4. The proportion of people self-directing who report they want more help in deciding how to use their budget/services.
5. The proportion of people self-directing who receive information about their budget/services that is easy to understand.
6. The proportion of people self-directing who report they can make changes to their individual budget/services if they need to.

Tables 49 through 55 present the results for these six core indicators.

All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

Information About How Much Money Is Left in Budget/Services Is Easy to Understand

^o Data are not reported because the response rate was too low (fewer than 20 respondents).

Relationships

People have friends and relationships.

There are seven Relationship indicators:

1. The proportion of people who have friends and caring relationships with people other than support staff and family members.
2. The proportion of people who have a close friend, someone they can talk to about personal things.
3. The proportion of people who are able to see their (a) families and (b) friends whenever they want.
4. The proportion of people who talk to their neighbors.
5. The proportion of people who feel lonely.
6. The proportion of people who can go on a date if they want to.
7. The proportion of people who report they get to help others.

Tables 56 through 63 present the results for these seven core indicators. The corresponding charts show un-collapsed averages.

All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

Satisfaction

People are satisfied with the services and supports they receive.

There are six Satisfaction indicators:

1. The proportion of people satisfied with where they live.
2. The proportion of people who would like to live somewhere else.
3. The proportion of people who are satisfied with their paid community job.
4. The proportion of people who have a paid community job who would like to work somewhere else.
5. The proportion of people who are satisfied with their day program or other daily activity.
6. The proportion of people who go to a day program or have another daily activity who would like to go somewhere else or do something else during the day.

Tables 64 through 70 present items that correspond to the Satisfaction domain. The corresponding charts show un-collapsed averages.

All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

[†] A lower percentage means a lower proportion of people want to go somewhere else or do something else during the day.

Service Coordination

Service coordinators are accessible, responsive, and support the person's participation in service planning.

There are seven Service Coordination indicators:

1. The proportion of people who have met their service coordinators.
2. The proportion of people reporting that their service coordinators ask them what they want.
3. The proportion of people reporting that service coordinators help them get what they need.
4. The proportion of people who report that their service coordinator calls them back right away.
5. The proportion of people whose support workers come when they are supposed to.
6. The proportion of people who get the help they need to work out problems with their support workers.
7. The proportion of people who report that they helped make their service plan.

Tables 71 through 77 present the results for these seven core indicators. The corresponding charts show un-collapsed averages.

All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

Access

Publicly funded services are readily available to individuals who need and qualify for them.

There are three Access indicators:

1. The rate at which people report that they get the services they need.
2. The proportion of people who report having adequate transportation when they want to go somewhere.
3. The proportion of people who feel their support staff have been appropriately trained to meet their needs.

Tables 78 through 81 present the results from the Access sub-domain. Table 80 presents modes of transportation used. The corresponding charts show un-collapsed averages.

All un-collapsed state data frequencies for these survey questions by state are displayed in Appendix B.

Health

People secure needed health services.

The Health indicators are collected with the Background Information section of the Adult Consumer Survey. The 12 core Health indicators are:

1. The proportion of people who have a primary care doctor.
2. The proportion of people who had a complete annual physical exam in the past year.
3. The proportion of people described as having poor health.
4. The proportion of people who had a routine dental exam in the past year.
5. The proportion of people who had a vision screening in the past year.
6. The proportion of people who had a hearing test in the past 5 years.
7. The proportion of women 18 and over who had a Pap test in the past 3 years.
8. The proportion of women 40 and over who had a mammogram in the past 2 years.
9. The proportion of men 50 and over who had a PSA test in the past year.
10. The proportion of people age 50 and older who had a screening for colorectal cancer in the past year.
11. The proportion of people who had a flu vaccination in the past year.
12. The proportion of people who have ever had a vaccination for pneumonia.

Tables 82 through 93 present the results for these 12 core indicators. The corresponding charts show un-collapsed averages.

All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

PLEASE NOTE: Unlike reports prior to 2009-2010, “DON’T KNOW” responses were not included in the denominator.

NCI Average	4%	12,406	6%	4%	4%	4%

ⁱ NH collected data on a two-year cycle (2011-12 and 2012-13) using the 2011-12 version of the Adult Consumer Survey both years; NH data is excluded in this table because the response options were different in the 2011-12 version from the 2012-13 version.

[‡] A lower percentage means a lower proportion of people are in poor health.

Medications

Medications are managed effectively and appropriately.

There is one Medications indicator collected using the Background Information section of the Adult Consumer Survey:

1. The proportion of people taking medications for mood disorders, anxiety, behavior problems, or psychotic disorders.

Table 94 presents the results for this core indicator. The corresponding chart shows un-collapsed averages.

All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

Table 94. Take medication for at least one of the following: mood disorders, anxiety, behavior problems, and/or psychotic disorders (information may have been obtained through state records or a proxy respondent)^Y

Takes Medication for Mood Disorders, Anxiety, Behavior Challenges, and/or Psychotic Disorders

^Y A lower percentage means a lower proportion of people are taking medication.

Wellness

People are supported to maintain healthy habits.

There is one Wellness indicator collected with the Background Information section of the Adult Consumer Survey:

1. The proportion of people who maintain healthy habits in such areas as:
 - a. Exercise
 - b. Weight
 - c. Smoking

Tables 95 through 97 present the results for these three core indicators. Table 96 presents simple proportions for the four BMI categories.

The corresponding charts show un-collapsed averages.

All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

Respect and Rights

People receive the same respect and protections as others in the community.

There are four Respect and Rights indicators:

1. The proportion of people whose basic rights are not respected by others, including:
 - a. People enter the home without permission
 - b. People enter bedroom without permission
 - c. Restrictions on being alone with others
 - d. Mail gets opened without permission
 - e. Restrictions on using the phone or Internet
2. The proportion of people who report satisfaction with the amount of privacy they have.
3. The proportion of people indicating that most support staff treat them with respect.
4. The proportion of people who have participated in a self-advocacy group meeting, conference, or event.

Tables 98 through 105 present items from the Respect and Rights sub-domain. The corresponding charts show un-collapsed averages.

All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

Table 98. People let them know before entering home ('yes' responses only)

Safety

People are safe from abuse, neglect, and injury.

There are two Safety indicators:

1. The proportion of people who report that they never feel scared or afraid in their home, neighborhood, workplace, and day program/daily activity.
2. The proportion of people who report having someone to go to for help when they feel afraid.

Tables 106 through 109 present the results for the four survey items measuring these indicators. The corresponding charts show un-collapsed averages.

All un-collapsed state data frequencies for these survey questions are displayed in Appendix B.

II. NCI History and Activities

This section briefly describes the history of the National Core Indicators and NCI Surveys

Overview of National Core Indicators

In December 1996, the National Association of State Directors of Developmental Disabilities Services (NASDDDS), in collaboration with Human Services Research Institute (HSRI), launched the Core Indicators Project (CIP). The aim of the project was to support state developmental disabilities operating agencies in the development and implementation of performance and outcome indicators—and related data collection strategies—so that they could measure service delivery system performance. This effort, now called National Core Indicators (NCI), strives to provide states with valid and reliable tools to help improve system performance and better serve people with intellectual and developmental disabilities and their families. Moreover, NASDDDS' active sponsorship of NCI facilitates pooled knowledge, expertise, and resources among the states.

In 1997, 15 states convened to discuss the scope and content of a potential performance measurement framework. Directors and staff from these 15 states worked to identify the major domains and sub-domains of performance, indicators, measures, and data sources. The original 61 indicators, developed through a consensus process, were intended to provide a system-level “snapshot” of how well each state was performing. The states were guided by a set of criteria that was designed to select indicators that were:

1. Measurable
2. Related to issues the states had some ability to influence
3. Important to all individuals they served, regardless of level of disability or residential setting.

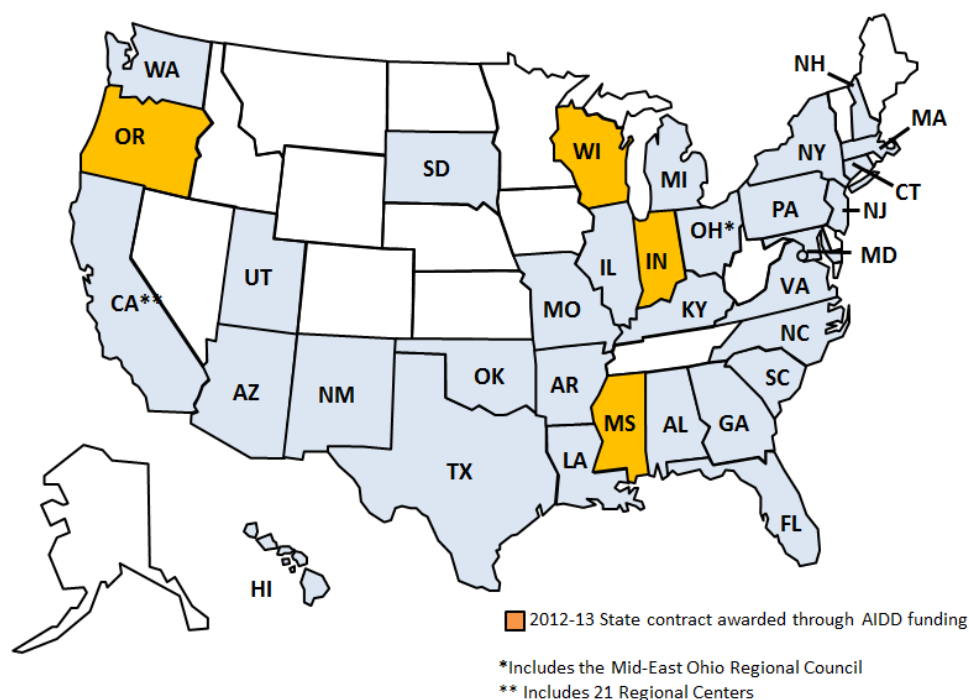

During this initial phase, data collection protocols were developed and field-tested, including a face-to-face Adult Consumer Survey (for individuals age 18 and older who were receiving services) and a mail-out Adult Family Survey (for families who have an adult family member living at home). Seven states volunteered to pilot test the indicators. Eight additional states served on the Steering Committee.

Since the initial field test, NCI has expanded its scope to include outcomes of services for children with intellectual and developmental disabilities and their families. In addition, NCI continues to develop and refine the indicators and expand state participation. For more information about NCI states, technical reports, and other resources, please visit <http://www.nationalcoreindicators.org>.

State Participation

During the 2012-2013 data collection cycle, 33 states and 22 sub-state entities participated in NCI. State participation is entirely voluntary, and the participating states are shown in the figure below.

Figure 1. NCI State Participation 2012-13

The Core Indicators

The Core Indicators are the standard measures used across states to assess the outcomes of services provided to individuals and families. Indicators address key areas of concern, including employment, respect/rights, service planning, community inclusion, choice, and health and safety. An example of a Core Indicator would be, “The proportion of people who have a paid job in the community.” To see the entire list of Core Indicators, please visit <http://www.nationalcoreindicators.org/indicators>.

Each survey instrument is designed to measure certain Core Indicators. While most indicators correspond to a single survey question, a few refer to clusters of related questions. For example, the indicator that measures Community Inclusion (the proportion of people who regularly participate in everyday integrated activities in their communities) is measured by several survey questions that ask about separate community activities.

The current set of performance indicators includes approximately 100 consumer, family, system, and health and safety outcomes—outcomes that are important for understanding the overall

health of public developmental disabilities agencies. Indicators are organized across five broad domains: Individual Outcomes; Health, Welfare and Rights; Staff Stability and Competency; Family Outcomes; and System Performance. Each domain is broken down into sub-domains (see Table 110). Four data sources are used to assess outcomes: the Adult Consumer Survey, three Family Surveys, a Provider Survey (e.g., staff turnover), and system data from state administrative records (e.g., mortality rates).

The indicators have remained generally consistent over the years and thus can be used to analyze system-level trends over time. However, the NCI program is a dynamic effort that allows for measures to be added, dropped, or changed to reflect the current and future priorities of participating states.

The data collection tools used to gather indicator data are regularly refined and tested to ensure they remain valid, reliable, and applicable to current issues within the field. Details on the design and testing of this tool are provided in the next section of this report.

Domains and Sub-Domains

The following table lists the domains and sub-domains covered by the NCI Adult Consumer Survey indicators.

Table 110. Adult Consumer Survey Indicators: Domains and Sub-Domains

Domain	Sub-Domain	Concern Statement
Individual Outcomes	Work	People have support to find and maintain community integrated employment.
	Community Inclusion	People have support to participate in everyday community activities.
	Choice and Decision-Making	People make choices about their lives and are actively engaged in planning their services and supports.
	Self Determination	People have authority and are supported to direct and manage their own services.
	Relationships	People have friends and relationships.
	Satisfaction	People are satisfied with the services and supports they receive.
Health, Welfare, and Rights	Safety	People are safe from abuse, neglect, and injury.
	Health	People secure needed health services.
	Medications	Medications are managed effectively and appropriately.
	Wellness	People are supported to maintain healthy habits.
	Respect/Rights	People receive the same respect and protections as others in the community.
Staff Stability and Competence	Staff Competence	Direct contact staff are competent to provide services and support.
System Performance	Service Coordination	Service coordinators are accessible, responsive, and support the person's participation in service planning.
	Access	Publicly funded services are readily available to individuals who need and qualify for them.

How NCI Data Are Used

The Core Indicators provide information for quality management and are intended to be used in conjunction with other state data sources, such as risk management information, regional level performance data, results of provider monitoring processes, and administrative information gathered at the individual service coordination level. States typically use the indicator data to inform strategic planning, produce legislative reports, and prioritize quality improvement initiatives. Some states use NCI as a data source for supplemental performance measures in their home and community-based services (HCBS) waiver quality management systems and include the information in support of evidentiary reports to the Centers for Medicare & Medicaid Services (CMS). Many states share the indicator data with stakeholder groups such as Quality Councils and use the stakeholder feedback to help set priorities and establish policy direction. It is also

important to note that states do not use the information in a punitive way to sanction service providers, nor do they use the results to remediate individual issues (unless specifically requested by the participant or required by law as in the case of suspected abuse, neglect, or mistreatment).

Caution and Limitations

This report does not provide benchmarks for acceptable or unacceptable levels of performance. Rather, it is up to each state to decide whether its score or percentage is an acceptable performance level. States that fall into the “below average” tier on any scale or indicator are not necessarily underperforming; instead, this placement indicates only that the state’s scale score or indicator percentage is significantly lower than the average of all states—where “significantly” means “not due to chance.” The results tables throughout this report display states’ scores relative to one another and show which states tend to have similar results. Notably, the difference between a “below average” state and the average across the other states may be very small, and it is up to public managers, policy-makers, and other stakeholders to decide whether a state’s result relative to the NCI Average suggests that changes or further investigation are necessary.

Moreover, the NCI Average should not be interpreted as defining “acceptable” levels of performance or satisfaction. Instead, it represents a multi-state “norm” that describes average levels of performance or satisfaction across the participating states. In some instances there are few significant differences among the states; this denotes that the majority of states are performing similarly. Instances in which several states’ results are especially high (considerably above the average level) indicate the levels of performance or satisfaction achieved in those states might define a level of performance that may serve as a guidepost for other states.

Data from previous years are not presented in this report. Comparisons of results from year to year should be made with caution: even slight changes in wording or response options of certain questions may affect comparability of results from one year to the next; the mix of participating states differs slightly each year and may affect the NCI Averages; and states draw new samples each year rather than following the same group of individuals.

III. Methodology

This section describes the protocol for administering the Adult Consumer Survey, including sampling criteria, administration guidelines, and surveying procedures.

Administration

A key principle of NCI is the importance of gathering information directly from service recipients. The indicators are meant to apply to all individuals receiving services, regardless of disability type, and NCI administration protocols dictate that every person selected into the sample is given an opportunity to respond (no one is prescreened or predetermined to be unable to respond). Moreover, survey questions should not be marked “not applicable” on the basis of a person’s level of ability.

Information for the Adult Consumer Survey is collected via a direct conversation with the person receiving services. Additionally, background information is primarily collected from the individual’s record. Section I questions, which pertain to personal experiences and require subjective responses, may only be answered by the individual receiving services. Section II of the survey—which consists of objective questions on the individual’s involvement in the community, their choices, respect and rights, and their access to services—allows for the use of “proxy” or other respondents who know the individual well (such as a family member or friend).

Proxy Respondents

Studies have found that the greatest discrepancies between individual and proxy responses occur when the information being collected is subjective (i.e., related to how a person feels; proxies would be aware of the correct answers only if the individual had previously expressed his or her feelings)⁸. Questions relating to observable behaviors tend to have higher levels of agreement. By excluding proxies, a large percentage of individuals (most of whom are unable to respond) would be unrepresented in the data. Thus, the NCI project determined at the outset that proxy respondents would be used, though only for specific questions and only in situations where the individual surveyed either could not effectively communicate with the surveyor or chose to have a proxy respondent.

As mentioned, the use of proxy respondents for the NCI tool is limited to questions in Section II, which relates to observable and/or measurable items: Community Inclusion, Choices, Respect/Rights, and Access to Needed Services. These questions deal with everyday occurrences on which others may reliably report. State records are also used to report objective data on an

⁸ Magaziner, Jay, Sheryl Zimmerman, Ann L. Gruber-Baldini, J. Richard Hebel, and Kathleen M. Fox. "Proxy Reporting in Five Areas of Functional Status Comparison with Self-Reports and Observations of Performance." *American Journal of Epidemiology* 146.5 (1997): 418-28.

individual's health status and exam history as well as employment status; this information is collected in the Background Section of the survey.

There are also ways to reduce discrepancies that may arise. First, it is important to make the questions as accessible as possible to increase participation by all individuals. NCI attempts to make the language in the Adult Consumer Survey as easy to understand as possible and includes suggested rephrasing for questions that may be nuanced or more difficult to understand. The NCI surveys are also routinely revised based on feedback from states, self-advocates, families, and surveyors who are administering the tool. Secondly, it is important to establish a set of standards for proxy respondents. NCI aims to increase the reliability of proxy responses by allowing only those people who know the individual well (family, friends, staff, etc.) to serve as proxy respondents. To avoid conflict, service coordinators are not allowed to respond as proxies. Further, if both the individual and a proxy respondent answer a question, the individual's answer is recorded so long as his/her answer is deemed reliable by the surveyor. Surveyors also keep track of who responds to each question—the individual or the proxy—and the proxy's relationship to the individual.

Surveyor Training

States employ a variety of individuals to conduct the face-to-face meetings for the NCI Adult Consumer Survey. To avoid conflict, surveyors cannot be administered by the individual's service provider, relative, personal case manager, staff member, or other close contact. Given this constraint, states often use university students, state staff, private contractors, advocacy organizations, and individuals with disabilities and their families to conduct the surveys.

HSRI and NASDDDS staff provide both on-site surveyor training to new states and refresher trainings (via webinar) for states that have previously participated. Typically, this instruction takes the form of a "train-the-trainer" session, whereby training is provided to a group of staff from the state's lead agency and/or those managing the surveyors. These individuals then go on to train those who will conduct the actual face-to-face surveys. However, often the on-site trainings are attended by the surveyors themselves. Either way, the goal is to provide a standardized training to ensure uniform application of the survey.

Trainings consist of a detailed review of the survey tool and an overview of general surveying techniques. Trainers are given a packet of standardized materials to be used at the on-site training sessions. An additional session reviews the process for entering survey data in the Online Data Entry Survey Application (ODESA).

Criteria for Exclusion of Responses

All individuals selected in the survey sample are given an opportunity to participate in a face-to-face meeting. There are no prescreening procedures. Exclusion of responses occurs at the time of data analysis by HSRI, based on the criteria described below. There is no threshold of number of answers to be given in order to consider a survey complete. The total number of surveys administered in 2012-13 was 13,157.

Surveys are excluded if the following criteria are met:

1. There are no valid answers to Section I or II; or
2. Section II is not completed, or has been completed only by the individual; and
 - a. The surveyor determines that the individual receiving services did not understand the questions being asked in Section I.
 - b. The surveyor records that the individual receiving services gave inconsistent responses in Section I.

Responses for Section I

Only individuals receiving services may answer questions in Section I. As shown in Table 111, 71% of individuals in the total 2012-2013 sample were able to respond to Section I of the direct meeting. Table 112 also shows the percentage of valid responses by state, which ranged from 52% to 97%.

Responses for Section II

Section II allows for multiple respondents who know the individual well (e.g., family, friend, support worker) to provide answers. If an individual's responses were excluded from Section I in the final analysis, responses from Section II were also excluded if the individual was the only respondent to Section II. For 2012-13, the valid response rate (proxies included) to Section II was 98%.

Sampling

Each state is instructed to attempt to complete a minimum of 400 surveys with a random sample of individuals over the age of 18 who are receiving at least one publicly funded service besides case management. A sample size of 400 guarantees valid comparisons to be made across states with a 95% confidence level and a margin of error of $\pm 5\%$, no matter how large the service population size. A 95% confidence level and a margin of error of $\pm 5\%$ is mandatory for each state's sample to be included in this report. Most states sample more than 400 individuals to account for refusals and surveys that may be deemed invalid. Table 111 presents the number of surveys completed by state. A more detailed description of each state's sampling strategy can be found in Appendix C.

Table 111. Valid Surveys and Response Rates by State: 2012-13

State	% Valid Answers to Section I	% Valid Answers to Section II	Number of Valid Surveys Completed	% of Total Sample Size (N)

IV. Data Analysis

This section explains the statistical methods used to analyze the Adult Consumer Survey data. It includes an explanation of how certain outcomes are “adjusted” for the purposes of making comparisons across states. This section also discusses scale construction and significance testing of results.

Data Management and Analysis

HSRI coordinates the NCI data management and analysis. Most states enter data into the Online Data Entry Survey Application (ODESA) system⁹; HSRI staff subsequently download the data into an SPSS data file. This data file is then “cleaned” (reviewed for completeness and compliance with standard NCI formats) and invalid responses are eliminated. Files from individual states are then merged into a single SPSS file. The merged file from 2012-2013 was used for all analyses in this report.

Below is a summary of the statistical procedures used to analyze the Adult Consumer Survey data.

Outcome Adjustment

Outcome adjustment or “risk adjustment” is a statistical process used to control for differences in the individual characteristics of people who completed the NCI Survey across states. This procedure allows for more legitimate state comparisons by effectively “leveling the playing field.” This analysis helps account for the fact that states have different eligibility definitions for services and may have samples with different characteristics. Only those indicators that are likely to be affected by individual characteristics were adjusted (e.g., indicators in the Choice and Community Inclusion sub-domains). For example, a person who has limited mobility and is older may be less likely to participate in shopping or other community activities. On the other hand, such characteristics should not affect whether a person has friends or staff who are respectful.

The indicators are risk-adjusted using the following seven characteristics: age, level of intellectual disability, primary means of expression (spoken or not), level of mobility, health status, mental illness/psychiatric diagnosis, and whether any behavioral supports are needed to prevent self-injury, disruptive, or destructive behavior. In this report, results for indicators that were adjusted are labeled as such, and unadjusted results are presented in Appendix A.

For this report, outcome adjustment was performed using logistic regression. This statistical analysis produced a predicted value that one would expect to observe given the individual’s characteristics. The state’s average observed rate (i.e., the state average prior to risk-adjustment) was adjusted by the average predicted rate to produce the risk-adjusted rate. As a result of this procedure, differences in adjusted indicators reflect true state differences rather than differences due to the demographic or characteristic makeup of state service populations.

⁹ Beginning in 2013-14, all states will be required to enter NCI data into ODESA.

Scale Development

Scales are used to combine similar responses from multiple questions into one outcome. In this way we can measure an overarching concept rather than specific elements of the concept. For the Adult Consumer Survey, scales are used for two sub-domains: 1) Community Inclusion and 2) Choice and Decision-Making. To create a scale, statistical tests are required to ensure that the multiple items share common properties.

For this report, the Choice and Decision-Making sub-domain was divided into two scales: Life Decisions and Everyday Choices. These scales were created by averaging the items within those categories¹⁰ for each individual. The Community Inclusion sub-domain consists of a single scale that was created by totaling the individual's scores for four of the questions relating to the number of times people went out in the community for particular activities. Higher scale scores represent higher levels of community inclusion and choice. The scales were also risk-adjusted.

Each scale's reliability was assessed using Cronbach's alpha. The scales had an adequate level of internal consistency and reliability.

Collapsing Data

For many of the indicators in this report, only "yes" responses are analyzed and reported for state to state comparisons and significance testing. However, there are several indicators for which the "yes" response was collapsed with the middle response (for example, a "sometimes" response, or a "some input" response) to form the "yes" indicator category which was then analyzed and subsequently reported. For example, for choice indicators, responses "person chose" and "person had some input" were collapsed into one "yes, person chose" category. For those indicators, the two responses were considered to be equally indicative of a positive outcome. Appendix A contains the collapsing and recoding rules for all indicators and risk-adjustment variables.

Significance Testing

In this report, for all non-adjusted items, each state's score was compared to the NCI Average (the average across all NCI states). These comparisons were conducted using t-tests. T-tests were performed only on non-adjusted indicators.

The t-test analyses determined whether each state's percentage was:

1. Significantly higher than the other states' average (NCI Average, average of averages),

¹⁰ Indicators used for scales are listed in the corresponding sections.

2. Within the average range (i.e., not statistically different from the NCI Average); or
3. Significantly lower than the other states' average.

A conservative cut-off point of $p \leq 0.005$ was used to determine significant differences. The placement of each state into one of these three groups is indicated in tables for each outcome.

Appendix A

Rules for Recoding and Combining Variables to Compute Core Indicators

Table A1. Background Information Variables Used to Adjust Outcomes

BI Item #	Variable Name	Recode or Collapse?
BI-3	DOB	Create AGE variable
BI-9a	LEVELMR08	5 categories: a) No ID ; b) Mild ; c) Moderate ; d) Severe ; and e) Profound

Appendix C

State sample strategies

ALABAMA: A random sample was drawn from just the people receiving ICF/ID and HCBS Waiver services. This sample was random within this parameter. All drawn were adults 18 and over who received at least one service besides case management.

ARKANSAS: A sample of approximately 300 individuals receiving waiver services and approximately 100 individuals receiving ICF/MR services. All were over 18. The sample was a proportional stratified random sample, using Case Manager Providers as the strata.

CONNECTICUT: A random sample was drawn from the entire service population of adults over age 18, who receive at least one service besides case management. The sample was then stratified by Region.

FLORIDA: A stratified sample was drawn (by support coordinator and then two individuals from each coordinator were randomly selected) from the entire service population who receive at least one service besides case management. All individuals age 3 and over are selected but only NCI surveys with adults age 18 and over are completed.

GEORGIA: The Georgia Quality Management System (GQMS) contract mandates that each provider rendering services through the Medicaid waivers to individuals with developmental disabilities has one annual review over the course of 5 years. Forty providers are reviewed each year through the Quality Enhancement Provider Review (QEPR) process (39 service providers and one support coordinator agency). Providers to receive the QEPR are randomly selected each year and 480 individuals for the Person Centered Reviews (who receive the NCI Adult Consumer Survey) are randomly selected from the caseloads of the 39 service providers. The PCR sample is stratified by region and providers, meaning providers were first randomly selected proportionately from each region, and then individuals were randomly selected from those providers.

HAWAII: A random sample was drawn from the entire service population of adults over age 18 who receive at least one waiver service besides case management.

ILLINOIS: A random sample was drawn from the entire service population of adults over age 18 who receive at least one waiver service besides case management.

INDIANA: Two proportional stratified random samples, using districts as strata, were pulled. One sample is for Family Support Waiver, the second sample is for Community Integration and Habilitation Waiver. Family Support Waiver participants slightly over-sampled. Within this

parameter, the sample was random and from the entire service population of adults over 18 and receiving at least one service other than case management.

KENTUCKY: Sampled the entire service population of adults over 18 receiving at least one service besides case management.

LOUISIANA: Sampled the entire service population of adults over 18 receiving at least one service besides case management.

MARYLAND: Sampled the entire service population of adults over 21 receiving at least one service besides case management. Individuals had to be receiving services for at least one year.

MEORC: A random sample was drawn from the entire service population of adults over age 18 who receive at least one waiver service besides case management.

MISSOURI: A sample was drawn by the MO Division of Developmental Disabilities to assure all regions of the state were represented. Each of the 11 regions were given 75 consumer names and asked to complete 40 surveys for their region, while each Habilitation Center completed 15 surveys. Within this parameter, the sample was random and from the entire service population of adults over 18 and receiving at least one service other than case management.

MISSISSIPPI: Did not provide HSRI their sampling strategy.

NORTH CAROLINA: Sampled the entire service population of adults over 18 receiving at least one service besides case management.

NEW HAMPSHIRE: Sampled the entire service population of adults over 21 receiving at least one service besides case management.

NEW JERSEY: Sampled the entire service population of adults over 21 receiving at least one service besides case management.

NEW YORK: Sampled the entire service population of adults over 18 receiving at least one service besides case management.

OHIO: A random sample of individuals 18 years and over who receive services from the county boards of development disabilities. An individual must be receiving services other than solely service and support administration or family support services. Ohio's sample included waiver and non-waiver individuals, such as residents of ICF/IDs.

OREGON: A stratified proportional sample was drawn from the entire service population of adults over age 18 who receive at least one waiver service besides case management. The strata being the 5 mutually exclusive types of services received (24-hour residential services).

PENNSYLVANIA: A sample was drawn from the entire service population of the Office of Developmental Persons (ODP) registered adults over 18 receiving at least case management or one other service. People surveyed in the prior year are excluded. Each of 48 Administrative Entities across the state (which cover a county or a group of smaller counties) arrange with an independent monitoring program to have up to 30 surveys completed from a random sample of 90 individuals issued by the state.

SOUTH CAROLINA: Sampled the entire service population of adults over 18 receiving at least one service besides case management.

TEXAS: A representative sample was drawn for each the programs included in the survey and stratified across the individual county.

UTAH: A proportional stratified random sample was drawn, including both the HCBS Waiver and the ICF/DD populations, of adults over age 18 who receive at least one service besides case management.

VIRGINIA: Sampled individuals who are 18 years or older and receive services from the Intellectual Disabilities & Day Support Waivers from 15 Community Services Board regions. The selected sample was proportional to the number of people who use ID & Day Support Waiver Services in each region.

WISCONSIN: A random sample of individuals over the age of 21 who were receiving case management and at least one additional Division service.
